NEW YORKER

CURRENCY

THE HYPE—AND HOPE—OF ARTIFICIAL INTELLIGENCE

By Om Malik August 26, 2016

F arlier this month, on his HBO show "Last Week Tonight," John Oliver skewered media companies' desperate search for clicks. Like many of his bits, it became a viral phenomenon, clocking in at nearly six million views on YouTube. At around the ten-minute mark, Oliver took his verbal bat to the knees of Tronc, the new name for Tribune Publishing

Much like "the cloud," "big data," and "machine learning" before it, the term "artificial intelligence" has been hijacked by marketers and advertising copywriters.

Photograph by Erich Hartmann / Magnum

Maybe that's just the way it is? We know there's a lot of hype...

What can Al do for your business?

COMCAST BAB BUILT FOR BUSINESS

PRODUCTIVITY@WORK

AUGUST 2017

NAVIGATING THE SMB TECH REVOLUTION

Artificial intelligence (AI) has been the darling of science fiction writers for decades, but it's fiction no more—and is now becoming accessible to small and

While it's easy to make fun of the hype...there are repercussions

July 12, 2017

IBM (IBM)

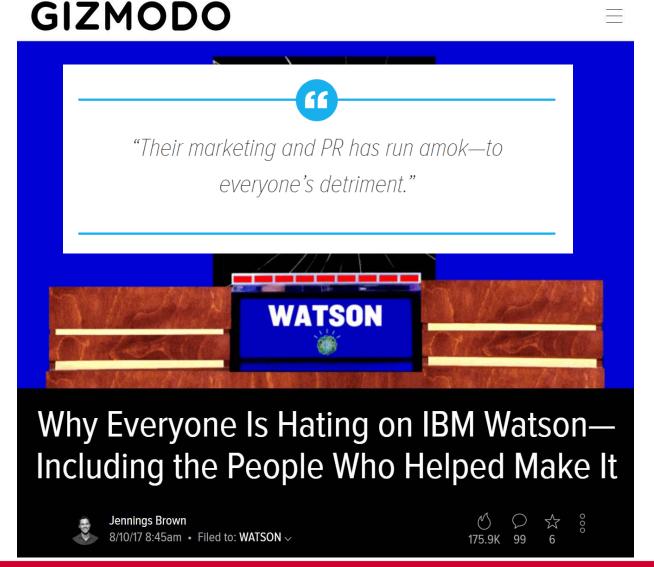

Creating Shareholder Value with AI? Not so Elementary, My Dear Watson

Key Takeaway

Our checks suggest that while IBM offers one of the more mature cognitive computing platforms today, the hefty services component of many Al deployments will be a hindrance to adoption. We also believe IBM appears outgunned in the war for Al talent and will likely see increasing competition. Finally, our analysis suggests that the returns on IBM's investments aren't likely to be above the cost of capital. Reiterate Underperform.

Al is the New Electricity....Our checks confirm that a wide range of organizations are exploring incorporating Al in their business, mostly using Machine and Deep Learning for speech and image recognition applications.

...But Competitive Environment Doesn't Favor IBM. Our checks suggest that IBM's Watson platform remains one of the most complete cognitive platforms available in the marketplace today. However, many new engagements require significant consulting work to gather and curate data, making some organizations balk at engaging with IBM. As outlined

So what do we do?

ARTIFICIAL INTELLIGENCE

Beware the Hype of Artificial Intelligence

Jonathan Vanian Jun 23, 2017

Artificial intelligence has made great strides in the past few years, but it's also generated much hype over its current capabilities.

That's one takeaway from a Friday panel in San Francisco involving leading AI experts hosted by the Association for Computing Machinery for its 50th annual Turing Award for advancements in computer science.

Michael Jordan, a machine learning expert and computer science professor at University of California, Berkeley, said there is "way too much hype" regarding the capabilities of so-called chat bots. Many of these software

Don't believe the hype when it comes to Al

Artificial intelligence may be subject to more hype than any other field. While this creates funding opportunities, it could also damage Al's long-term potential

Jun 26 · 3 min read

In a few years, no investors are going to be looking for AI startups

But the reason I believe that no investor will be funding startups calling themselves AI-powered startups (and no startup CEO will differentiate themselves as an AI-first company like Google) is because investors will assume the startup is using the best available AI techniques to solve the problem they are solving.

Awesome they have machine learning in the cloud!

Components of a Productive ML Sniff Test

- Surface-level understanding of some core ML concepts
- Sniff test procedure
- General tips

A Quick Brush of Core ML Concepts

- Generalization
 - How will my system perform when I turn it on?
 - To the future, changing environment, new users, additional markets, different geographies, etc.

A Quick Brush of Core ML Concepts

- Generalization
 - How will my system perform when I turn it on?
 - To the future, changing environment, new users, additional markets, different geographies, etc.
- The amalgamation of rules inside these systems make assumptions
 - Not knowing the assumptions you're making is gambling

A Quick Brush of Core ML Concepts

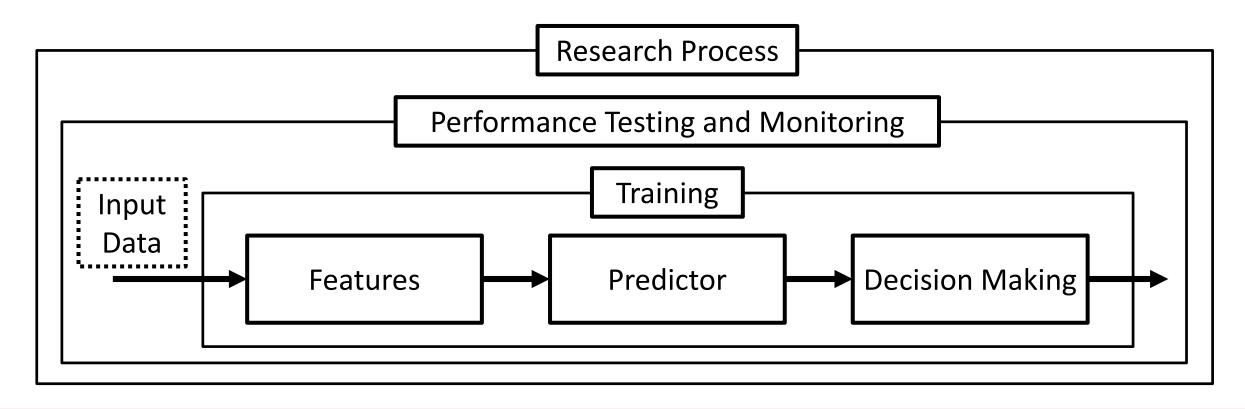

- Generalization
 - How will my system perform when I turn it on?
 - To the future, changing environment, new users, additional markets, different geographies, etc.
- The amalgamation of rules inside these systems make assumptions
 - Not knowing the assumptions you're making is gambling
- No such thing as zero human involvement

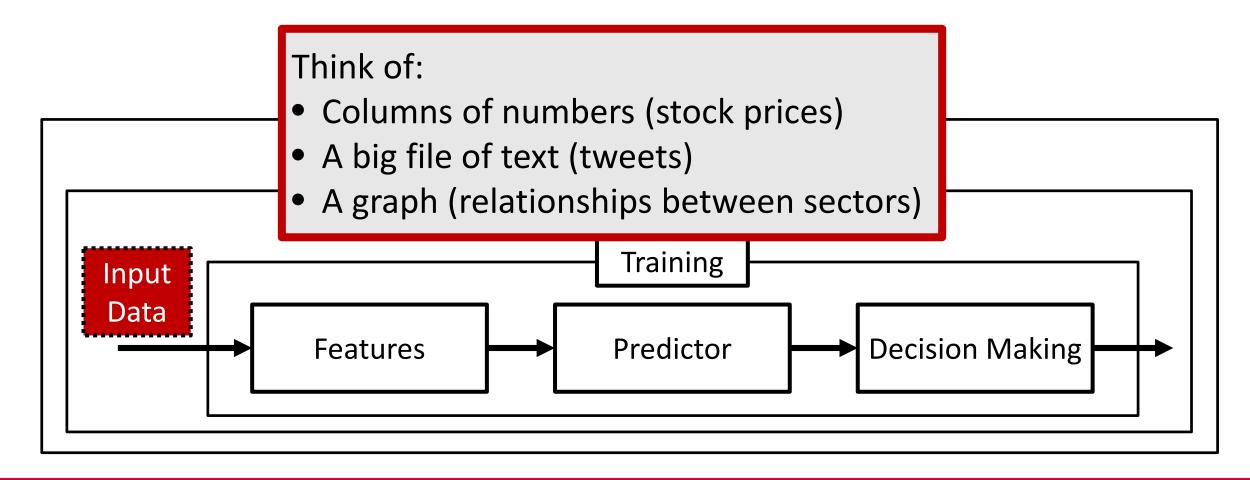

Components of a Productive ML Sniff Test

- Surface-level understanding of some core ML concepts
- Sniff test procedure
 - Construct your mental picture of their overall approach
 - Dig deeper and refine the edges
- General tips

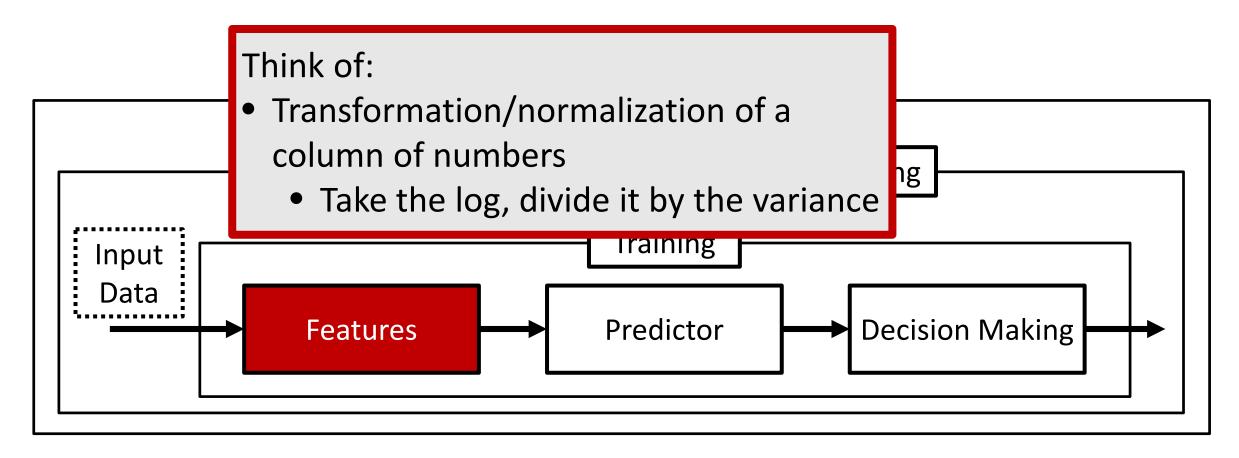

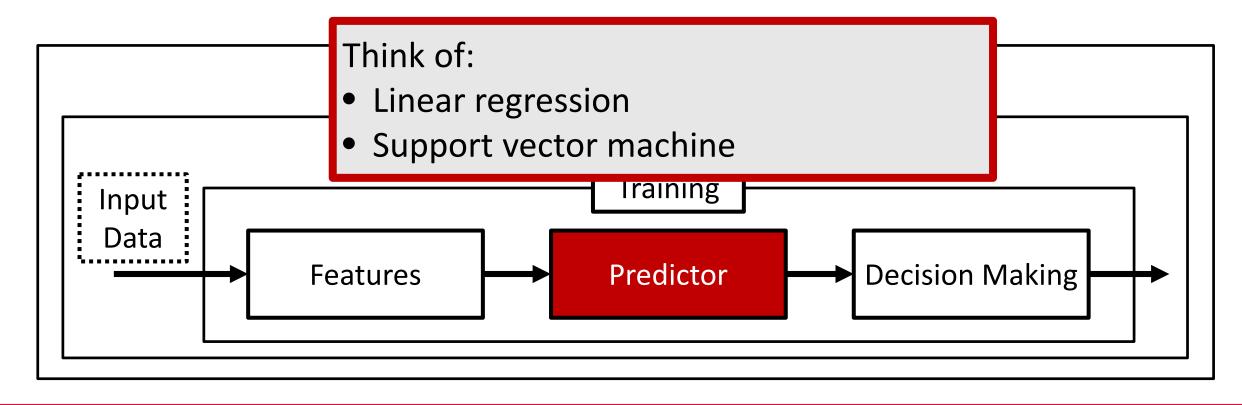

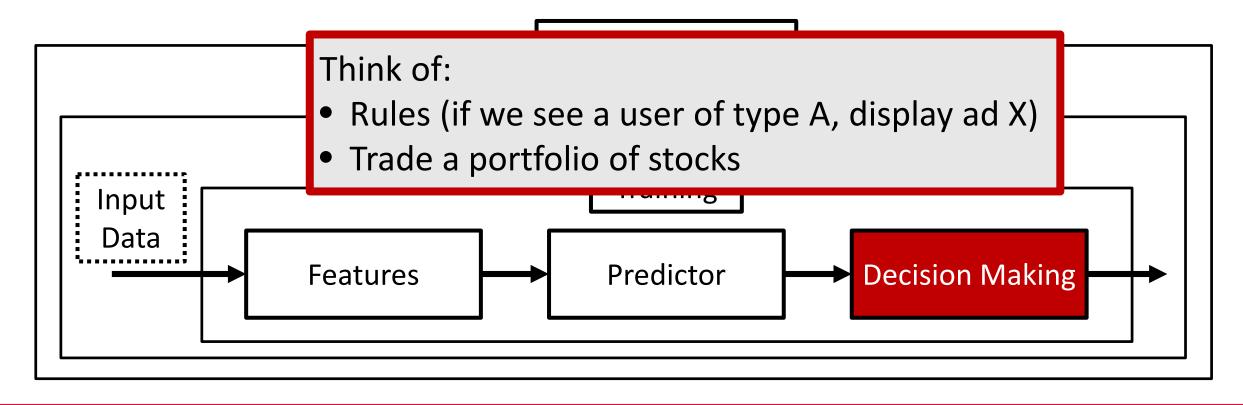

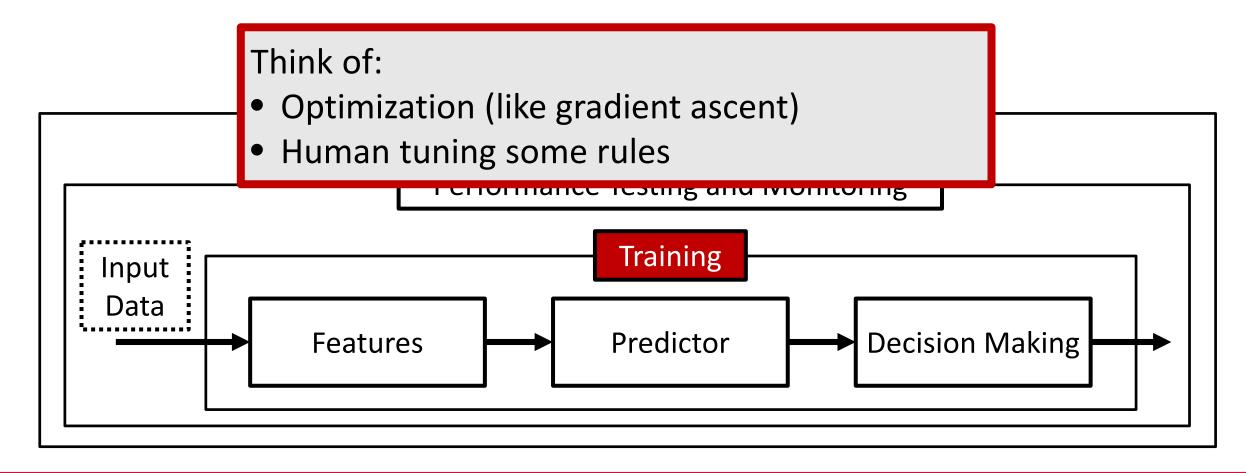

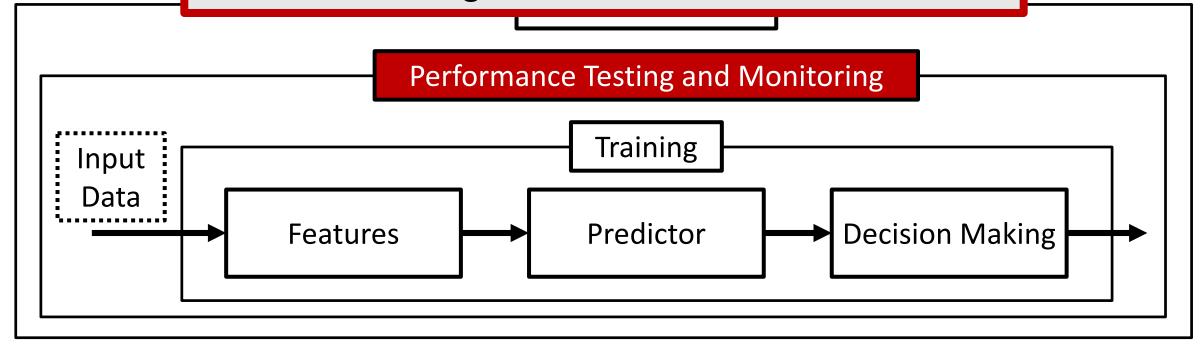

Think of:

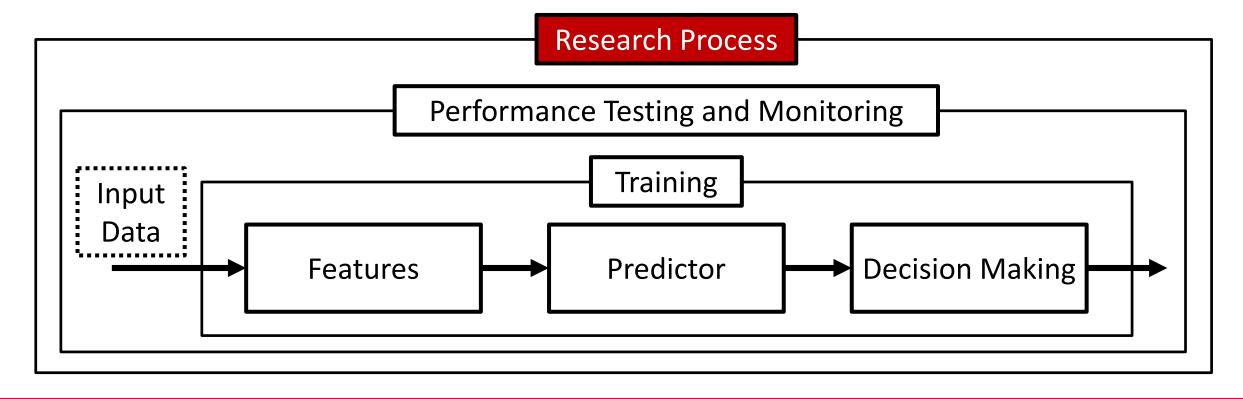

- Computing out-of-sample performance
- Comparing live performance to a historical estimate
- Statistical testing

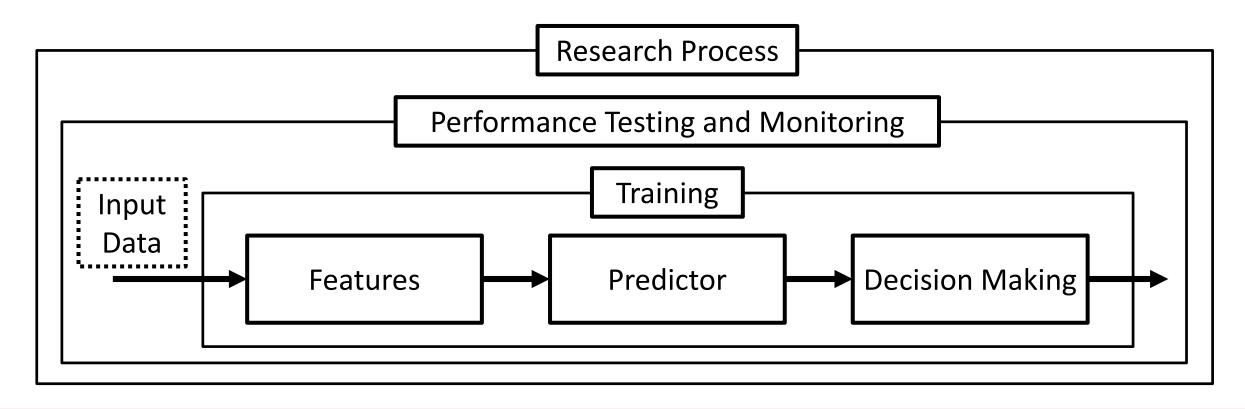

Think of:

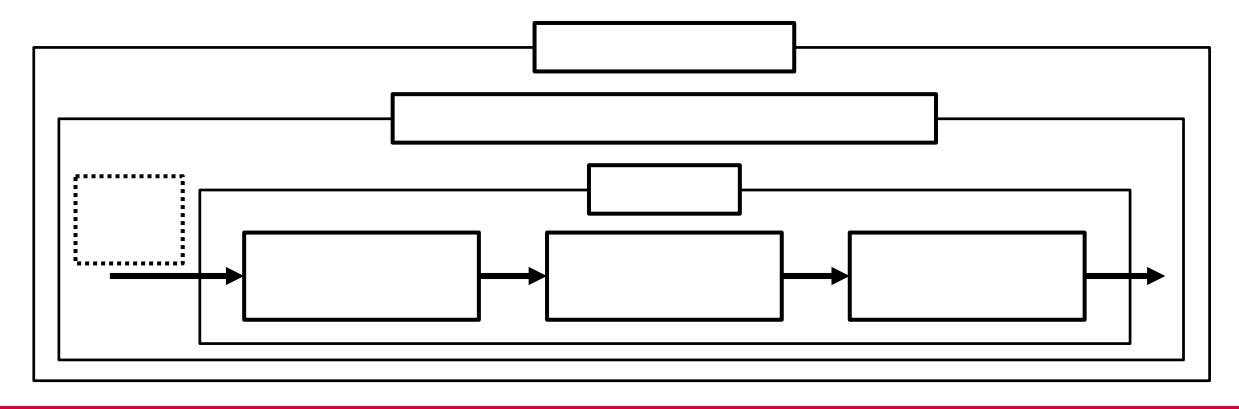

- How does the system get improved?
- What happens when something stop working well?

Components of a Productive ML Sniff Test

- Surface-level understanding of some core ML concepts
- Sniff test procedure
 - Construct your mental picture of their overall approach
 - High-level ML system initial mental picture
 - Find the fuzzy-power words game to connect the story to the system
 - Dig deeper and refine the edges
- General tips

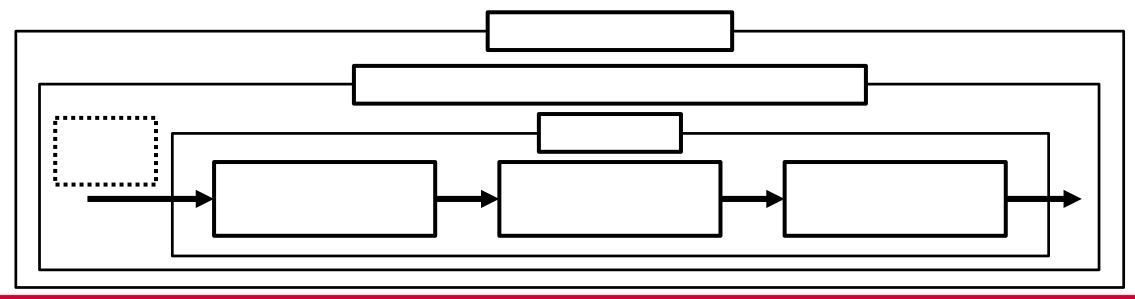

Find the Fuzzy-Power Words Game

- Words/phrases that are said in a way say to convey of sense of
 - "The bullshitter doesn't care if what they say is true or false, but rather only cares whether or not their listener is persuaded"
- (For tech people) you've hit one if it's not clear how it is implementable in a computer
- Best way to articulate this is by example
- (Names and details have been changed to protect the innocent)

Integrity Gaps Across Hops

- The purpose here is to discover if these "integrity gaps" are that:
 - They simplified it for our benefit
 - They don't view the gap as a gap and it's our misunderstanding
 - They are trying to deceive us

Components of a Productive ML Sniff Test

- Surface-level understanding of some core ML concepts
- Sniff test procedure
 - Construct your mental picture of their overall approach
 - High-level ML system initial mental picture
 - Find the fuzzy-power words game to build the full tree of how the story and system connects
 - Dig deeper and refine the edges
 - Probe into integrity gaps across hops
 - Understand how well thought through each concrete box is with lists of questions
- General tips

Lists of questions on each component of the system

- * Where does the data come from?
- * How much history do you have?
- * What is the resolution of your data?
- * Are there any large gaps or outages in your data?
- * What kind of sanity checking, cleaning, and outlier detection/removal do you do?
- * How do you check for changes in the data format? How many times has that happened?
- * What is the biggest source of noise in the data?
- * Who else has access to the same data?
- * Has anyone used data like yours to solve a problem like yours?
- * How much "human curation" is in your data?
- * What filtering is in place?
- * How is the data stored?
- * Are there sporadic performance-effecting latencies in your data arrival?
- * Can you give me specific examples of what your data actually is?

- * How do you represent features in your system?
- * How often do you add/change/remove features?
- * Can you give me three concrete examples of features that are currently live in your system? * How do you actually perform the fitting/learning/search/optimization?
- * How much human domain knowledge is imbedded in your features?
- * Do you normalize/transform your features somehow?
- * How do you handle heterogenous data sources?
- * Roughly, how many features do you use?
- * (If feature selection, dimensionality reduction, etc. methods are used)
- * Why were these methods chosen?
- * What effect do they have on the system's overall performance?
- * Why do these features make sense for the decisions you want to make?

- * What is the meaning of the prediction output?
- * What type of representation do you use to go from features to a prediction?
- * On what timescales is your system outputting predictions?
- * How does your system quantify its uncertainty in a prediction?
- * Why did you chose that representation from the many, many of other methods?
- * What alternate methods did you try? Why were those passed on?
- * How much human domain knowledge is imbedded in your prediction representation?
- * Do you explicitly regularize or measure/control the complexity your representation somehow? * Can you explain a couple situations of both unexpectedly high and low performance?
- * What are other successful applications of your chosen representation?
- * Why does your predictor representation make sense for the decisions you want to make?
- * If more than one predictor (for example, using ensembles):
- * Roughly how many models do you use?
- * Do you find most of your performance comes from a few of the models?
- * How do you validate that you increase performance by adding additional models?

Decision making:

- * What is the meaning of the decisions you are making?
- * On what timescales is your system outputting decisions?
- * What type of representation do you use to go from a prediction to a decision?
- * What alternate methods did you try? Why were those passed on?
- * How much human domain knowledge is imbedded in your decision making representation?
- * How does your system quantify its uncertainty in a prediction?
- * Why does your decision making representation make sense for the decisions you want to make?

Training:

- * What parts of your system "learn" from data?
- * Where do your labels come from? How accurate are they?
- * How much human domain knowledge is in the fitting process?
- * What is the rough ratio of (# data points)/(# features)?
- * Do you believe there is systematic noise in your data somehow? How do you correct for it?

 * What objective function do you use? Why? How did it come about? How much tuning was
 - * Roughly what order of magnitude of parameters are you fitting?
 - * What are alterative objective functions you have tried?

 - * What alternative optimization techniques have you previously tried? Why were those
 - * How do you understand if your system is overfitting/underfitting?
 - * How often do you re-fit your representations? How much does that increase your performance?

Performance testing:

- * How do you test the performance of your overall system?
- * How do you test the performance of single components of your system (e.g., the decision
- * Exactly how large is your train/test/holdout sets? How are they kept separate?
- * What assumptions is your overall approach making? How have you validated these assumptions
- * What are the metrics you use to measure performance across your system?
- * What is your overall performance? With confidences.
- * How do common baseline methods perform on your problem? With performance and confidences.

- * What do you believe is the maximum achievable performance? Why?
- * How have the dynamics of your data/problem changed over time?
- * How much do your estimated and live performances differ? What are the sources of these
- differences? How do you represent and compensate for them?
- * Do you validate against simulated data where you know your assumptions hold? How is the simulated data generated?
- * Does your performance make intuitive sense to you? Why or why not?

Monitoring for performance changes:

- * How are you monitoring for performance changes?
- * How often do you expect to detect changes in performance?
- * Do you have methods for early-detection of performance changes for each individual component before it shows up in overall performance?
- * When has your monitoring caught a change in performance?
- * How do you think about the difference between an anomalous environmental condition and a change in performance?

Research process:

- * Describe your overall research philosophy
- * For any change that is made to the overall system (method, implementation, etc), what is the process that validate and approves the change?
- * How often is the methodology or a component of the system changed?
- * Who has access to the entire data set? What policies are in place to prevent data snooping?
- * What change made it through your validation process that turned out to decrease

performance? Why did that happen? How was your process changed to prevent this from happening again in the future?

- * What is the likely next research piece to make it into production?
- * What roles comprise your research team? Why?
- * How do you allocate time across your team?
- * What part of your system keeps you up at night? Why?
- * What has worked much better/worse than you had expected?
- * How is your live system influencing/corrupting your future data? How are you correcting for
- * What other data sources have you investigated?
- * How closely does your in-sample data represent your out-of-sample?

(Don't worry, you don't have to read it all. It's there so you have lists of questions for later.)

Components of a Productive ML Sniff Test
